### Description

The Harris CD74HC174 and CD74HCT174 are edge triggered flip-flops which utilize silicon gate CMOS circuitry to implement D-type flip-flops. They possess low power and speeds comparable to low power Schottky TTL circuits. The devices contain six master-slave flip-flops with a common clock and common reset. Data on the D input having the specified setup and hold times is transferred to the Q output on the low to high transition of the CLOCK input. The  $\overline{MR}$  input, when low, sets all outputs to a low state.

Each output can drive ten low power Schottky TTL equivalent loads. The CD74HCT174 is functional as well as, pin compatible to the 74LS174.
